Arm Slings
- Arm slings immobilise and protect an injured arm
- Broken arms are a common reason for wearing a sling however contusions, sprains, and dislocations can also require a sling
Living with Arthritis can be uncomfortable and painful. You may experience stiffness, inflammation and damage to the cartilage in your joints resulting in weakness, instability, reduced range of movement and joint deformities. There are over 100 forms of arthritis that can affect people of all ages.

Arthritis can heavily impact on daily function including the most basic of tasks such as preparing meals, walking around the home, driving, tying laces and button up shirts. Fortunately, there is a wide range of equipment available to assist with daily tasks to allow you to maintain an independent lifestyle whilst living with arthritis.

A stroke occurs when the blood supply to the brain is interrupted. This interruption can be caused by a burst of an artery or a blockage, which then fails to supply the brain with sufficient oxygen and nutrients, therefore causing brain cells to die. It is important to seek immediate medical advice and engage in a post-stroke rehabilitation program. These programs are designed to promote recovery of partially damaged brain cells and retrain skills that were affected.

Hip and knee joint replacements are helping people live active and pain-free lives. When an entire joint is damaged, a surgeon will conduct a whole joint replacement. The hip or knee joint is replaced with an artificial part known as a ‘prostheses’ or ‘implant’.

There are guidelines to remember for 6 weeks post-operation to ensure maximum recovery such as: sitting with hips and knees in 90 degrees flexion; do not cross legs; support hip and knee placement during sleep; avoid excessive joint mobility; avoid high impact activity.

It is important to consult with your Doctor, Physiotherapist, Occupational Therapist or other health professional and follow their recommendations. To make the process easier, you may purchase daily living aids, seating supports, pillows and mobility aids prior to surgery so that all the equipment is available and ready for you upon discharge from hospital.

Falls are more likely to occur in older people and can result in injuries such as hip and wrist fractures, dislocations, sprains, head injuries, abrasions and bruising.

The cause for falls varies depending on age, medical history, cognitive impairment, low weight, gait disorders or environmental hazards to name a few.

It is important to implement preventative measures to decrease the chances of a fall particularly for those who are identified to be at high risk. Such measures can include installing grab rails and safety equipment in wet areas, mobility aids and hip protectors, and removing clutter and other hazardous items around clearance spaces within the home.
**BARIATRIC**

Obesity is an increasing issue in our population posing a demand for equipment in larger configurations. Aidacare, in conjunction with AusBIG, states that a bariatric client may have one or more of the following characteristics:

- Weigh more than 125kg
- BMI of over 35
- Seat width of over 50cm

Bariatric equipment is designed to assist in pressure management, heat management of the client and effective weight distribution on the seating surface.

Aidacare’s bariatric equipment range caters for all functional needs including mobility, community access, self-care, bedding, posture & seating and aids for daily living.

---

**MOBILITY & ACCESS**

Access and mobility are issues that touch everyone’s life at one time or another.

Many people experience reduced mobility in various situations including young people with sporting injuries, older people with less agility or people with disability. It is therefore crucial to acknowledge that the entire community benefits from a more accessible environment.

This overview was put together to give you an overview of the mobility equipment that can help you overcome the obstacles you might face.
